

Vacuum massage in scars treatment

Scars, Fibrosis, Burns

may generate pain, functional disorders and aesthetic problems that require treatment.

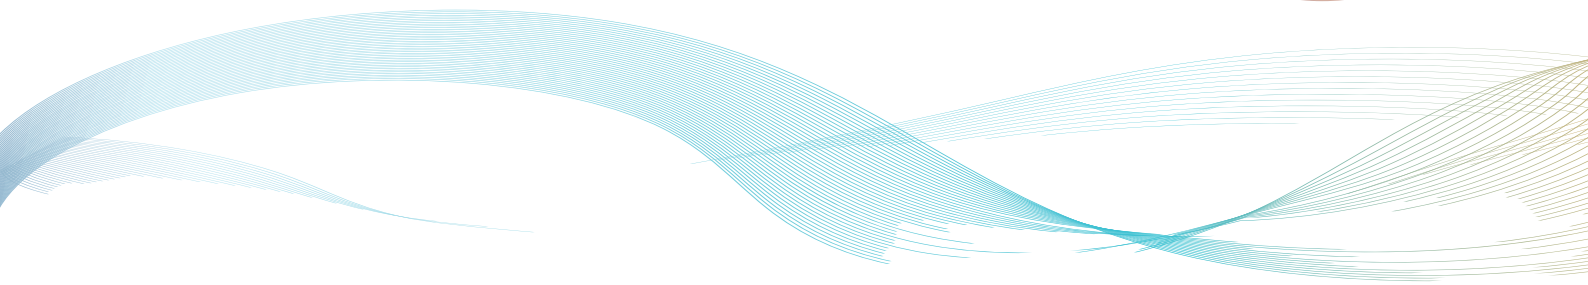

Vacuum massage, also known as Vacuotherapy or Depressomassage, is the appropriate technology for tissue rehabilitation.

A specific solution to treat scars

Vacuum massage is extremely effective to treat traumatic or burn scars. It improves tissue hardness and elasticity, reduces the soreness of adherent scars, drains toxins and stimulates microcirculation.

An action targeting limited surfaces

The choice of the size, the shape and the diameter of the suction cup depends on the pathology and the size of the surface to treat. The device is very handy and allows to operate on limited surfaces, which otherwise could not be treated.

Vacuum massage

A secured technology

The precision of settings - from 0,05 to 0,9 bars - and the transparency of suction cups allow for constant visual control of the medical procedure.

A painless protocol

The vacuum can be adjusted from case to case: type, intensity, continuous/alternative, ...
Sessions last around 20 minutes.

High quality and approved devices

Manufactured in France in compliance with ISO 13485, CE Medical certified and FDA approved, with a 3-year warranty.

Vacuum Massage Medical Devices
CE Medical 0459 / Classe IIa
